

threads

why threads?

concurrency: different things happening at once

- one thread per user of web server?

- one thread per page in web browser?

- one thread to play audio, one to read keyboard, ...?

- ...

parallelism: do same thing with more resources

- multiple processors to speed-up simulation (life assignment)

single and multithread processes

single-threaded process

multi-threaded process

pthread_create

```
void *ComputePi(void *argument) { ... }
void *PrintClassList(void *argument) { ... }
int main() {
    pthread_t pi_thread, list_thread;
    pthread_create(&pi_thread, NULL, ComputePi, NULL);
    pthread_create(&list_thread, NULL, PrintClassList, NULL);
    ... /* more code */
}
```

pthread_create

```
void *ComputePi(void *argument) { ... }  
void *PrintClassList(void *argument) { ... }  
int main() {  
    pthread_t pi_thread, list_thread;  
    pthread_create(&pi_thread, NULL, ComputePi, NULL);  
    pthread_create(&list_thread, NULL, PrintClassList, NULL);  
    ... /* more code */  
}
```

pthread_create arguments:

thread identifier

function to run thread starts here, terminates if this function returns

thread attributes (extra settings) and function argument

pthread_create

```
void *ComputePi(void *argument) { ... }  
void *PrintClassList(void *argument) { ... }  
int main() {  
    pthread_t pi_thread, list_thread;  
    pthread_create(&pi_thread, NULL, ComputePi, NULL);  
    pthread_create(&list_thread, NULL, PrintClassList, NULL);  
    ... /* more code */  
}
```

pthread_create arguments:

thread identifier

function to run thread starts here, terminates if this function returns

thread attributes (extra settings) and function argument

pthread_create

```
void *ComputePi(void *argument) { ... }
void *PrintClassList(void *argument) { ... }
int main() {
    pthread_t pi_thread, list_thread;
    pthread_create(&pi_thread, NULL, ComputePi, NULL);
    pthread_create(&list_thread, NULL, PrintClassList, NULL);
    ... /* more code */
}
```

pthread_create arguments:

thread identifier

function to run thread starts here, terminates if this function returns

thread attributes (extra settings) and function argument

pthread_create

```
void *ComputePi(void *argument) { ... }  
void *PrintClassList(void *argument) { ... }  
int main() {  
    pthread_t pi_thread, list_thread;  
    pthread_create(&pi_thread, NULL, ComputePi, NULL);  
    pthread_create(&list_thread, NULL, PrintClassList, NULL);  
    ... /* more code */  
}
```

pthread_create arguments:

thread identifier

function to run thread starts here, terminates if this function returns

thread attributes (extra settings) and function argument

a threading race

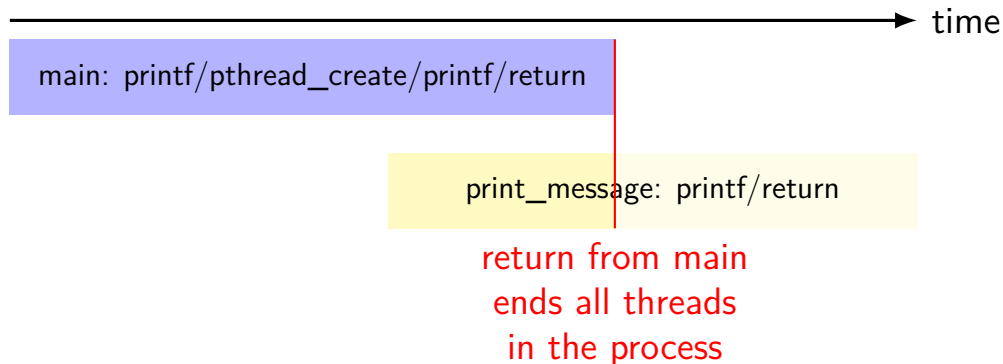

```
#include <pthread.h>
#include <stdio.h>
void *print_message(void *ignored_argument) {
    printf("In the thread\n"); return NULL;
}
int main() {
    printf("About to start thread\n");
    pthread_t the_thread;
    pthread_create(&the_thread, NULL, print_message, NULL);
    printf("Done starting thread\n");
    return 0;
}
```

My machine: outputs In the thread about 4% of the time.
What happened?

a race

returning from main **exits the entire process** (all its threads)
same as calling exit; not like other threads

race: main's return 0 or print_message's printf first?

fixing the race (version 1)

```
#include <pthread.h>
#include <stdio.h>
void *print_message(void *ignored_argument) {
    printf("In the thread\n");
    return NULL;
}
int main() {
    printf("About to start thread\n");
    pthread_t the_thread;
    pthread_create(&the_thread, NULL, print_message, NULL);
    printf("Done starting thread\n");
    pthread_join(the_thread, NULL); /* WAIT FOR THREAD */
    return 0;
}
```

fixing the race (version 2; not recommended)

```
#include <pthread.h>
#include <stdio.h>
void *print_message(void *ignored_argument) {
    printf("In the thread\n");
    return NULL;
}
int main() {
    printf("About to start thread\n");
    pthread_t the_thread;
    pthread_create(&the_thread, NULL, print_message, NULL);
    printf("Done starting thread\n");
    pthread_exit(NULL);
}
```

pthread_join, pthread_exit

`pthread_join`: wait for thread, retrieves its return value
like `waitpid`, but for a thread
return value is pointer to anything

`pthread_exit`: exit current thread, returning a value
like `exit` or returning from `main`, but for a single thread
same effect as returning from function passed to `pthread_create`

sum example (only globals)

```
int values[1024];
int results[2];
void *sum_front(void *ignored_argument) {
    int sum = 0;
    for (int i = 0; i < 512; ++i) { sum += values[i]; }
    results[0] = sum;
    return NULL;
}
void *sum_back(void *ignored_argument) {
    int sum = 0;
    for (int i = 512; i < 1024; ++i) { sum += values[i]; }
    results[1] = sum;
    return NULL;
}
int sum_all() {
    pthread_t sum_front_thread, sum_back_thread;
    pthread_create(&sum_front_thread, NULL, sum_front, NULL);
    pthread_create(&sum_back_thread, NULL, sum_back, NULL);
    pthread_join(sum_front_thread, NULL); pthread_join(sum_back_thread, NULL);
    return results[0] + results[1];
}
```

sum example (only globals)

values, results: global variables — shared

```
int values[1024];
int results[2];
void *sum_front(void *ignored_argument) {
    int sum = 0;
    for (int i = 0; i < 512; ++i) { sum += values[i]; }
    results[0] = sum;
    return NULL;
}
void *sum_back(void *ignored_argument) {
    int sum = 0;
    for (int i = 512; i < 1024; ++i) { sum += values[i]; }
    results[1] = sum;
    return NULL;
}
int sum_all() {
    pthread_t sum_front_thread, sum_back_thread;
    pthread_create(&sum_front_thread, NULL, sum_front, NULL);
    pthread_create(&sum_back_thread, NULL, sum_back, NULL);
    pthread_join(sum_front_thread, NULL); pthread_join(sum_back_thread, NULL);
    return results[0] + results[1];
}
```

sum example (only globals)

two different functions

happen to be the same except for some numbers

```
int values[1024];
int results[2];
void *sum_front(void *ignored_argument) {
    int sum = 0;
    for (int i = 0; i < 512; ++i) { sum += values[i]; }
    results[0] = sum;
    return NULL;
}
void *sum_back(void *ignored_argument) {
    int sum = 0;
    for (int i = 512; i < 1024; ++i) { sum += values[i]; }
    results[1] = sum;
    return NULL;
}
int sum_all() {
    pthread_t sum_front_thread, sum_back_thread;
    pthread_create(&sum_front_thread, NULL, sum_front, NULL);
    pthread_create(&sum_back_thread, NULL, sum_back, NULL);
    pthread_join(sum_front_thread, NULL); pthread_join(sum_back_thread, NULL);
    return results[0] + results[1];
}
```

sum

values returned from threads
via global array instead of return value
(partly to illustrate that memory is shared,
partly because this pattern works when we don't join (later))

```
int values[1024];
int results[2];
void *sum_front(void *ignored_argument) {
    int sum = 0;
    for (int i = 0; i < 512; ++i) { sum += values[i]; }
    results[0] = sum;
    return NULL;
}
void *sum_back(void *ignored_argument) {
    int sum = 0;
    for (int i = 512; i < 1024; ++i) { sum += values[i]; }
    results[1] = sum;
    return NULL;
}
int sum_all() {
    pthread_t sum_front_thread, sum_back_thread;
    pthread_create(&sum_front_thread, NULL, sum_front, NULL);
    pthread_create(&sum_back_thread, NULL, sum_back, NULL);
    pthread_join(sum_front_thread, NULL); pthread_join(sum_back_thread, NULL);
    return results[0] + results[1];
}
```

thread_sum memory layout

0xFFFF FFFF FFFF FFFF

0xFFFF 8000 0000 0000

0x7F...

values, results (global)

0x0000 0000 0040 0000

thread_sum memory layout

sum example (to global, with thread IDs)

```
int values[1024];
int results[2];
void *sum_thread(void *argument) {
    int id = (int) argument;
    int sum = 0;
    for (int i = id * 512; i < (id + 1) * 512; ++i) {
        sum += values[i];
    }
    results[id] = sum;
    return NULL;
}
int sum_all() {
    pthread_t thread[2];
    for (int i = 0; i < 2; ++i) {
        pthread_create(&threads[i], NULL, sum_thread, (void *) i);
    }
    for (int i = 0; i < 2; ++i)
        pthread_join(threads[i], NULL);
    return results[0] + results[1];
}
```

sum example (to global, with thread IDs)

```
int values[1024];
int results[2];
void *sum_thread(void *argument) {
    int id = (int) argument;
    int sum = 0;
    for (int i = id * 512; i < (id + 1) * 512; ++i) {
        sum += values[i];
    }
    results[id] = sum;
    return NULL;
}
int sum_all() {
    pthread_t thread[2];
    for (int i = 0; i < 2; ++i) {
        pthread_create(&threads[i], NULL, sum_thread, (void *) i);
    }
    for (int i = 0; i < 2; ++i)
        pthread_join(threads[i], NULL);
    return results[0] + results[1];
}
```

values, results: global variables — shared

sum example (info struct)

```
int values[1024];
struct ThreadInfo {
    int start, end, result;
};
void *sum_thread(void *argument) {
    struct tThreadInfo *my_info = (struct ThreadInfo *) argument;
    int sum = 0;
    for (int i = my_info->start; i < my_info->end; ++i) { sum += values[i]; }
    my_info->result = sum;
    return NULL;
}
int sum_all() {
    pthread_t thread[2]; struct ThreadInfo info[2];
    for (int i = 0; i < 2; ++i) {
        info[i].start = i*512; info[i].end = (i+1)*512;
        pthread_create(&threads[i], NULL, sum_thread, &info[i]);
    }
    for (int i = 0; i < 2; ++i) { pthread_join(threads[i], NULL); }
    return info[0].result + info[1].result;
}
```

sum example (info struct)

```
int values[1024];
struct ThreadInfo
    int start, end, result;
};
void *sum_thread(void *argument) {
    struct tThreadInfo *my_info = (struct ThreadInfo *) argument;
    int sum = 0;
    for (int i = my_info->start; i < my_info->end; ++i) { sum += values[i]; }
    my_info->result = sum;
    return NULL;
}
int sum_all() {
    pthread_t thread[2]; struct ThreadInfo info[2];
    for (int i = 0; i < 2; ++i) {
        info[i].start = i*512; info[i].end = (i+1)*512;
        pthread_create(&threads[i], NULL, sum_thread, &info[i]);
    }
    for (int i = 0; i < 2; ++i) { pthread_join(threads[i], NULL); }
    return info[0].result + info[1].result;
}
```

values: global variable — shared

sum example (info struct)

```
int values[1024];
struct ThreadInfo {
    int start, end, result;
};
void *sum_thread(void *argument) {
    struct tThreadInfo *my_info = (struct ThreadInfo *) argument;
    int sum = 0;
    for (int i = my_info->start;
        my_info->result = sum;
        return NULL;
    }
int sum_all() {
    pthread_t thread[2]; struct ThreadInfo info[2];
    for (int i = 0; i < 2; ++i) {
        info[i].start = i*512; info[i].end = (i+1)*512;
        pthread_create(&threads[i], NULL, sum_thread, &info[i]);
    }
    for (int i = 0; i < 2; ++i) { pthread_join(threads[i], NULL); }
    return info[0].result + info[1].result;
}
```

my_info: pointer to sum_all's stack;
only okay because sum_all waits!

sum example (info struct)

```
int values[1024];
struct ThreadInfo {
    int start, end, result;
};
void *sum_thread(void *argument) {
    struct tThreadInfo *my_info = (struct ThreadInfo *) argument;
    int sum = 0;
    for (int i = my_info->start; i < my_info->end; ++i) { sum += values[i]; }
    my_info->result = sum;
    return NULL;
}
int sum_all() {
    pthread_t thread[2]; struct ThreadInfo info[2];
    for (int i = 0; i < 2; ++i) {
        info[i].start = i*512; info[i].end = (i+1)*512;
        pthread_create(&threads[i], NULL, sum_thread, &info[i]);
    }
    for (int i = 0; i < 2; ++i) { pthread_join(threads[i], NULL); }
    return info[0].result + info[1].result;
}

thread joining

`pthread_join` allows collecting thread return value

if you don't join joinable thread, then **memory leak!**

thread joining

pthread_join allows collecting thread return value

if you don't join joinable thread, then **memory leak!**

avoiding memory leak?

always join...or

“detach” thread to make it not joinable

pthread_detach

```
void *show_progress(void * ...) { ... }  
void spawn_show_progress_thread() {  
    pthread_t show_progress_thread;  
    pthread_create(&show_progress_thread, NULL,  
                  show_progress, NULL);
```

/ instead of keeping pthread_t around to join thread later: */*

```
pthread_detach(show_progress_thread);
```

```
}
```

```
int main() {  
    spawn_show_progress_thread();  
    do_other_stuff();  
    ...  
}
```

detach = don't care about return value, etc.
system will deallocate when thread terminates

starting threads detached

```
void *show_progress(void * ...) { ... }  
void spawn_show_progress_thread() {  
    pthread_t show_progress_thread;  
    pthread_attr_t attrs;  
    pthread_attr_init(&attrs);  
    pthread_attr_setdetachstate(&attrs, PTHREAD_CREATE_DETACHED);  
    pthread_create(&show_progress_thread, attrs,  
                  show_progress, NULL);  
    pthread_attr_destroy(&attrs);  
}
```

setting stack sizes

```
void *show_progress(void * ...) { ... }  
void spawn_show_progress_thread() {  
    pthread_t show_progress_thread;  
    pthread_attr_t attrs;  
    pthread_attr_init(&attrs);  
    pthread_attr_setstacksize(&attrs, 32 * 1024 /* bytes */);  
    pthread_create(&show_progress_thread, attrs,  
                  show_progress, NULL);  
}
```

a note on error checking

from `pthread_create` manpage:

ERRORS

EAGAIN Insufficient resources to create another thread, or a system-imposed limit on the number of threads was encountered. The latter case may occur in two ways: the **RLIMIT_NPROC** soft resource limit (set via `setrlimit(2)`), which limits the number of process for a real user ID, was reached; or the kernel's system-wide limit on the number of threads, [`/proc/sys/kernel/threads-max`](#), was reached.

EINVAL Invalid settings in `attr`.

EPERM No permission to set the scheduling policy and parameters specified in `attr`.

special constants for *return value*

same pattern for many other pthreads functions

will often omit error checking in slides for brevity

error checking pthread_create

```
int error = pthread_create(...);  
if (error != 0) {  
    /* print some error message */  
}
```

backup slides

thread versus process state

thread state

- registers (including stack pointer, program counter)

- ...

process state

- address space

- open files

- process id

- list of thread states

- ...

process info with threads

parent process info

| | |
|--------------|---|
| thread infos | thread 0: {PC = 0x123456, rax = 42, rbx = ...} thread 1: {PC = 0x584390, rax = 32, rbx = ...} ... |
| page tables | |
| open files | fd 0: ... fd 1: ... |
| ... | ... |

Linux idea: `task_struct`

Linux model: single “task” structure = thread

pointers to address space, open file list, etc.

pointers **can be shared**

e.g. shared open files: open fd 4 in one task → all sharing can use fd 4

`fork()`-like system call “clone”: **choose what to share**

`clone(0, ...)` — similar to `fork()`

`clone(CLONE_FILES, ...)` — like `fork()`, but **sharing** open files

`clone(CLONE_VM, new_stack_pointer, ...)` — like `fork()`, but **sharing** address space

Linux idea: `task_struct`

Linux model: single “task” structure = thread

pointers to address space, open file list, etc.

pointers **can be shared**

`clone(0, ...)` — similar to `fork()`

`clone(CLONE_FILES, ...)` — like `fork()`, but **sharing** open files

`clone(CLONE_VM, new_stack_pointer, ...)` — like `fork()`, but **sharing** address space

advantage: no special logic for threads (mostly)

two threads in same process = tasks sharing everything possible

aside: alternate threading models

we'll talk about **kernel threads**

OS scheduler deals **directly** with threads

alternate idea: library code handles threads

kernel doesn't know about threads w/in process

hierarchy of schedulers: one for processes, one within each process

not currently common model — awkward with multicore
