

setjmp/longjmp

```
jmp_buf env;
```

```
main() {  
    if (setjmp(env) == 0) { // like try {  
        ...  
        read_file()  
    } else { // like catch  
        printf("some_error_happened\n");  
    }  
}
```

```
read_file() {  
    ...  
    if (open failed) {  
        longjmp(env, 1) // like throw  
    }  
    ...  
}
```

implementing setjmp/longjmp

setjmp:

- copy all registers to `jmp_buf`
... including stack pointer

longjmp

- copy registers from `jmp_buf`
... but change `%rax` (return value)

setjmp psuedocode

setjmp: looks like first half of context switch

setjmp:

```
movq %rcx, env->rcx
movq %rdx, env->rdx
movq %rsp + 8, env->rsp // +8: skip return value
...
save_condition_codes env->ccs
movq 0(%rsp), env->pc
movq $0, %rax // always return 0
ret
```

longjmp psuedocode

longjmp: looks like second half of context switch

longjmp:

```
movq %rdi, %rax // return a different value
```

```
movq env->rcx, %rcx
```

```
movq env->rdx, %rdx
```

```
...
```

```
restore_condition_codes env->ccs
```

```
movq env->rsp, %rsp
```

```
jmp env->pc
```

setjmp weirdness — local variables

Undefined behavior:

```
int x = 0;
if (setjmp(env) == 0) {
    ...
    x += 1;
    longjmp(env, 1);
} else {
    printf("%d\n", x);
}
```

setjmp weirdness — fix

Defined behavior:

```
volatile int x = 0;  
if (setjmp(env) == 0) {  
    ...  
    x += 1;  
    longjmp(env, 1);  
} else {  
    printf("%d\n", x);  
}
```

on implementing try/catch

could do something like `setjmp()/longjmp()`

but `setjmp` is *slow*

setjmp exercise

```
jmp_buf env; int counter = 0;
void bar() {
    putchar('Z');
    ++counter;
    if (counter < 2) {
        longjmp(env, 1);
    }
}
int main() {
    while (setjmp(env) == 1) {
        putchar('X');
    }
    putchar('Y');
    bar();
}
```

Expected output?

A. YZ

B. XYZ

C. YZYZ

D. XYZXYZ

setjmp exercise soln

```
jmp_buf env; int counter = 0;
void bar() {
    putchar('Z');           // 3 Z 12 Z
    ++counter;              // 4 13
    if (counter < 2) {      // 5 (1<2) 14 (2<2)
        longjmp(env, 1);   // 6*
    }                       // 15
}
int main() {
    while (setjmp(env) == 1) { // 0 (ret 0) 7*(ret 1) 9 (ret 0)
        putchar('X');         // 8 X
    }
    putchar('Y');            // 1 Y 10 Y
    bar();                   // 2 11
}                             // 16
```

on implementing try/catch

could do something like `setjmp()/longjmp()`

but `setjmp` is *slow*

low-overhead try/catch (1)

```
main() {
    printf("about to read file\n");
    try {
        read_file();
    } catch(...) {
        printf("some error happened\n");
    }
}

read_file() {
    ...
    if (open failed) {
        throw IOException();
    }
    ...
}
```

low-overhead try/catch (2)

```
main:
    ...
    call printf
start_try:
    call read_file
end_try:
    ret
```

```
main_catch:
    movq $str, %rdi
    call printf
    jmp end_try
```

```
read_file:
    pushq %r12
    ...
    call do_throw
    ...
end_read:
    popq %r12
    ret
```

lookup table

program counter range	action	recurse?
start_try to end_try	jmp main_catch	no
read_file to end_read	popq %r12, ret	yes
anything else	error	—

low-overhead try/catch (2)

```
main:
    ...
    call printf
start_try:
    call read_file
end_try:
    ret
```

```
main_catch:
    movq $str, %rdi
    call printf
    jmp end_try
```

```
read_file:
    pushq %r12
    ...
    call do_throw
    ...
end_read:
    popq %r12
    ret
```

    call do_throw
    ...
end_read:
    popq %r12
    ret
```

not actual x86 code to run
track a “virtual PC” while looking for catch block

lookup table

program counter range	action	recurse?
start_try to end_try	jmp main_catch	no
read_file to end_read	popq %r12, ret	yes
anything else	error	—

lookup table tradeoffs

no overhead if throw not used

handles local variables on registers/stack, but...

larger executables (probably)

extra complexity for compiler
